ABSTRACT:

PURPOSE: To facilitate the setting of a destination by displaying a map for setting the destination based on the address and telephone number of the destination etc., and at the same time display the detailed position of the destination.

CONSTITUTION: When a data reception part 38 inputs the address and telephone number of a destination from an electronic organizer, an operation processor 20 stores them at a RAM 203 and retrieves data which match an address list 245 and a telephone number list 246 at a storage 24. Then, a map including the

retrieved address data and the telephone number is retrieved from a map database 241 and the retrieved map is displayed on an image display 32 along with the address and telephone number as a map around the destination. Then, when a user specifies a display screen, the processor 20 recognizes the coordinate position. Then, with a current position detected by the current position detector 26 as a starting point, the path to the destination is retrieved and is displayed on the screen and guided. Further, when the destination is near, a more detailed destination map appears for positively guiding the path.
